CareSight AI

CareSight AI is an autonomous multimodal healthcare assistant that sees, listens, reads, and reasons across the patient journey to reduce administrative burden and improve clinical readiness.

The Problem

Healthcare intake is manual and error-prone

Nurses and doctors waste time on paperwork

Critical data is trapped in images, PDFs, and handwriting

Information gets lost between patient, nurse, and doctor

Healthcare already has the data. The problem is that it’s unstructured, scattered, and manually handled at every step.

Our Solution

Perception → Reasoning → Action

OCR & Vision perceive documents and images

Speech recognition listens to patient responses

LLM reasons across all inputs

The system autonomously prepares clinical summaries

We treat the healthcare workflow like an environment, and CareSight AI like an autonomous agent operating inside it.

How CareSight AI Works

1. Patient Intake (Mobile App)

- Upload documents & images
- Record voice responses
- OCR + CV + Speech → structured data

→

2. Nurse Check-In

- Auto-filled forms
- Missing info flagged
- Suggested verification questions

→

3. Doctor Review

- Concise clinical summary
- CV insights (e.g. skin, wounds)
- Cognitive screening results

Automation happens between humans, not instead of them

Automated Cognitive Screening

Records nurse–patient memory test

Speech-to-text transcribes responses

Automatically scores recall accuracy

Fills structured screening form

Flags uncertainty for review

Instead of manually scoring memory tests, CareSight AI listens, understands, and documents the results automatically.

Why This Is an Autonomous Agent

Sensors: camera, microphone, OCR

Perception: vision, speech, text extraction

State: structured patient profile

Reasoning: Gemma 3N

Actions: auto-fill, flag, summarize

Autonomy doesn’t require a robot arm. It requires perception, reasoning, and action — which our system demonstrates end-to-end.

Impact & Future Vision

Impact

- Saves clinician time
- Reduces documentation errors
- Improves patient experience
- Enables Remote Healthcare Access

Future Vision

- EHR integration
- Remote clinics & disaster response
- Longitudinal patient monitoring
- Autonomous Healthcare in Smart Environments
